- User defined Log LUT

Focus Assist

A focus-assist feature is important for focusing cameras.

False color

False color function refers to a group of color rendering methods used to display images in color which were recorded in the visible or non-visible parts of the electro-magnetic spectrum. A false-color image is an image that illustrates an object in colors that differ from those a photograph (a true color image) would show.
Gamma Adjustment

PBM-4K H series provides different Gamma adjustment settings, The monitor iscapable to select Gamma settings between (0.8 - 3.0)

Wide Color Gamut & Color Spaces support

PBM-4K-H is built with intelligent connections for calibration alignment, adjustable colormetry and gamma correction capabilities. The PBM-4K-H series can reproduce 3D LUT (ITU-R, BT.2020, D-Cenima, BT.709) color spaces.
